

Ech0 Architecture Atlas / Single Go Binary · Self-Hosted Timeline Platform

A single **synchronous request spine** runs down the center (handler → service → repository → DB); the **Agent subsystem** and the **event-driven subsystem** hang off the left and right wings as peer subsystems; four foundations — **config · tools · in-house libraries · local disk** — sit beneath the binary. Infrastructure is placed where it actually acts, not stacked into one uniform grid.

- Synchronous request spine
- Async events · Notify by Go type
- Dependency / I/O / outbound
- Key node / protection band
- ★ Top-level shared singleton (injected once)

1 Entry points / clients Three inbound classes + one outbound delivery

2 Ingress / routing · cross-cutting middleware internal/server · router.SetupRouter assemblies by module

3 Business domains · 15 domains / 4 clusters Each domain spans handler / service / repository / model · cross-layer imports use aliases
